

How to use

to reach your savings goals

Z5 Inventory's signature cost-saving service can help you at every scale, whether you want to optimize everything or just a small area, in a one-time project or on an ongoing basis. If you don't have the reverse-logistics or staffing resources necessary to move product between your facilities, don't worry! Z5 Inventory has the staff and experience necessary to make your project a success.

Systemwide inventory resilience

Problem

Excess supplies expire, wasting your inventory spend and forcing you to reassess supply levels.

Solution

Redistribute excess product according to need and prevent disposal to reach cost-saving and efficiency goals.

Facility shutdown

Problem

You were forced to close one or more healthcare facilities and worry you'll have to throw away all the medical and pharmaceutical supplies inside.

Solution

Identify all remaining product, then redistribute to your remaining facilities to maximize usage and minimize waste.

Departmental or warehouse optimization

Problem

A specific storage area is siloed or managed by non-materials staff and needs to be reassessed.

Solution

Identify product usage trends to optimize ordering. Redistribute existing product between this department and others to minimize waste.

Conversion

Problem

Changing brands or standardization left you with shelves of obsolete product headed for expiration.

Solution

Redistribute or sell products that have become obsolete due to conversion.

Clinician departure

Problem

A clinician who had strong product preferences has been replaced by a clinician with all-new preferences.

Solution

Redistribute or sell abandoned clinician preference products.

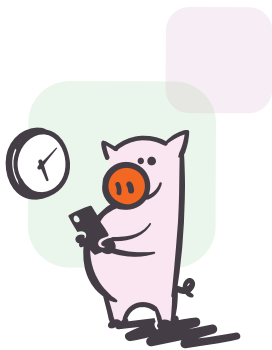

How to use

to count your supplies

Z5 Inventory's award-winning mobile app + online dashboard isn't just good for counting your shelves once a year (although it's definitely good for that). You can capture product data with Z5 Inventory throughout the year. And the best part is that the analytics are built in. You'll receive recommendations for improving your inventory's accuracy and efficiency as soon as you start counting.

Annual physical inventory

Problem

Counting all your medical and pharmaceutical supplies at once is disruptive and costly (but required).

Solution

Ease the pain of meeting your regulatory requirements and booking a trusted financial value.

Cycle counts

Problem

You don't have the resources to count individual areas all year long, rather than try to get everything counted all at once.

Solution

Cycle count areas throughout the year to avoid an annual count.

High-dollar product cycle counts

Problem

Expensive medical devices and equipment can't wait to be counted and tracked only once a year.

Solution

Scan and track expensive items for use, recalls, and expiration.

Expiration sweeps and tracking

Problem

Medical and pharmaceutical supplies not managed by supply chain pros are more likely to expire before use.

Solution

Capture expiration dates and value expired inventory.

Perpetual inventory

Problem

You need to update your perpetual inventory either because you need to make changes or because you don't trust the current data.

Solution

True up the product in your perpetual areas and reassess product locations.

Systemwide product discovery

Problem

Current inventory data is so outdated or insufficient that you need to start from scratch.

Solution

Find, locate, and document every product on every shelf to identify areas of improvement and show ROI for new projects.
